

CONSULTATION NOTE

Patient: David Thomas MRN: SYN-DC-1003 DOB: 1965-07-09
Date: 2026-03-28 Specialty: Cardiology / Rehabilitation
Reason for Consultation: Post-MI cardiac rehab evaluation

CLINICAL NOTE

Patient is a 60-year-old male, 1 week status post PCI with stenting for NSTEMI, referred for cardiac rehabilitation evaluation. Patient reports mild residual fatigue but denies recurrent chest pain, dyspnea at rest, or palpitations. Echocardiogram from index hospitalization showed ejection fraction of 45% with mild anterior wall hypokinesis. Patient ambulates independently, able to walk approximately 2 blocks before mild fatigue. Reviewed medication adherence; patient is compliant with dual antiplatelet therapy, statin, beta-blocker, and ACE inhibitor.

RECOMMENDATION

Patient is an appropriate candidate for Phase II cardiac rehabilitation, recommend enrollment within 2 weeks. Baseline exercise stress test deferred given recent PCI; will reassess at 6-week mark. Continue current medication regimen unchanged. Reinforced low-sodium, heart-healthy diet counseling.
