

CONSULTATION NOTE

Patient: Arjun Mehta MRN: SYN-DC-1001 DOB: 1978-03-14
Date: 2026-04-20 Specialty: Pulmonology
Reason for Consultation: Severe COPD, post-hospitalization follow-up

CLINICAL NOTE

Patient is a 47-year-old male with a 15-year history of COPD, former smoker (quit 2019, 20 pack-year history), referred for pulmonology evaluation following hospitalization for acute exacerbation. Patient reports baseline exertional dyspnea, occasional wheeze, and chronic productive cough, worse in winter months. Spirometry performed today shows FEV1 of 48% predicted, FEV1/FVC ratio of 0.58, consistent with severe airflow obstruction, GOLD stage III. Patient is currently on tiotropium and albuterol as needed. He has not previously been on a combination inhaled corticosteroid/LABA regimen. Discussed pulmonary rehabilitation, which patient has not yet attended.

RECOMMENDATION

Recommend initiation of combination ICS/LABA inhaler (budesonide/formoterol) in addition to current tiotropium. Strongly recommend enrollment in pulmonary rehabilitation program. Annual influenza and pneumococcal vaccination confirmed up to date. Follow-up spirometry in 3 months to assess response to therapy.
