CRP	42 mg/L	<10 mg/L	HIGH
Procalcitonin	0.18 ng/mL	<0.10 ng/mL	HIGH

INTERPRETATION

Leukocytosis with neutrophil predominance, elevated CRP and mildly elevated procalcitonin are suggestive of an active bacterial infectious or inflammatory process, consistent with the clinical picture of COPD exacerbation with possible bacterial component. Mild normocytic anemia is likely related to chronic disease. Recommend clinical correlation and repeat CBC after completion of antibiotic course.
